

# LIMMER HAIR TRANSPLANT CENTER

Our female hair loss patients require additional diagnostic attention due to unique factors such as hormonal fluctuations, vitamin and mineral imbalances, and potential autoimmune reactions. Therefore, before Drs. Krejci and Limmer can accurately treat female patients, our office requires pre-consultation labwork and a referral from a general dermatologist. Our physicians' primary focus is surgical hair transplantation; thus, they are considered a second opinion to a primary alopecia diagnosis. Sometimes surgery is a viable option for women, but not always. To help us best serve you, please supply the following information prior to scheduling your consultation:

## **Required Background Information for New Female Patients:**

Name: \_\_\_\_\_

Age: \_\_\_\_\_

How long has the hair loss been going on? \_\_\_\_\_

Is there any trauma or scarring that caused the hair loss?    Yes / no                  Biopsy?    Yes/no

What is your ALOPECIA diagnosis? \_\_\_\_\_  
(A diagnosis is required for consultation)

Name of Referring Dermatologist: \_\_\_\_\_
